

# Package ‘fnets’

October 13, 2022

**Type** Package

**Title** Factor-adjusted Network Estimation and Forecasting for High-dimensional Time Series

**Version** 0.1.1

**Maintainer** Haeran Cho <haeran.cho@bristol.ac.uk>

**Description** Implements methods for network estimation and forecasting of high-dimensional time series exhibiting strong serial and cross-sectional correlations under a factor-adjusted vector autoregressive model.

**Depends** R (>= 4.1.0)

**Imports** lpSolve,  
parallel,  
doParallel,  
foreach,  
MASS,  
fields,  
igraph,  
RColorBrewer

**License** GPL (>= 3)

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.2

bn.factor.number	<i>Factor number estimator of Bai and Ng (2002)</i>
------------------	---

---

**Description**

Estimates the number of restricted factors by minimising an information criterion. Currently the five information criteria proposed in Bai and Ng (2002) (`ic.op = 1, . . . , 5`) are implemented, with `ic.op = 2` recommended as a default choice based on numerical experiments.

**Usage**

```
bn.factor.number(  
  x,  
  lam = NULL,  
  f = NULL,  
  q.max = NULL,  
  ic.op = 2,  
  do.plot = FALSE,  
  center = TRUE  
)
```

**Arguments**

x	input time series matrix, with each row representing a variable
lam, f	loading and factor matrices; if <code>lam = NULL</code> or <code>f = NULL</code> , these are obtained with PCA
q.max	maximum number of factors; if <code>q.max = NULL</code> , a default value is selected as <code>min(50, floor(sqrt(min(dim(x)[2] - 1, dim(x)[1])))</code>
ic.op	chosen information criterion
do.plot	whether to plot the value of the information criterion
center	whether to de-mean the input x row-wise

**Details**

See Bai and Ng (2002) for further details.

**Value**

a list containing

q.hat	the minimiser of the chosen information criteria
lam	loading matrix
f	factor series
q.max	maximum number of factors
ic	vector of information criteria values

**References**

Bai, J. & Ng, S. (2002) Determining the number of factors in approximate factor models. *Econometrica*. 70: 191-221.

**Examples**

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
common <- sim.restricted(n, p)
idio <- sim.var(n, p)
x <- common$data * apply(idio$data, 1, sd) / apply(common$data, 1, sd) + idio$data

bn <- bn.factor.number(x, q.max = NULL, center = FALSE, do.plot = TRUE)
bn$q.hat
```

---

common.predict

---

*Forecasting the factor-driven common component*

---

**Description**

Produces forecasts of the common component for a given forecasting horizon by estimating the best linear predictors

**Usage**

```
common.predict(
  object,
  x,
  h = 1,
  common.method = c("restricted", "unrestricted"),
  r = NULL
)
```

## Arguments

object	fnets object
x	input time series matrix, with each row representing a variable
h	forecasting horizon
common.method	a string specifying the method for common component forecasting; possible values are: <ul style="list-style-type: none"> <li>• "restricted" performs forecasting under a restrictive restricted factor model</li> <li>• "unrestricted" performs forecasting under an unrestrictive, blockwise VAR representation of the common component</li> </ul>
r	number of restricted factors; if common.method = "restricted" and r = NULL, it is estimated as the maximiser of the ratio of the successive eigenvalues of the estimate of the common component covariance matrix, see Ahn and Horenstein (2013)

## Value

a list containing	
is	in-sample estimator of the common component
fc	forecasts of the common component for a given forecasting horizon h
r	restricted factor number
h	forecast horizon

## Examples

```
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.var.order = 1, idio.method = "lasso", lrpc.method = "none")
cpre <- common.predict(out, x, h = 1, common.method = "restricted", r = NULL)
ipre <- idio.predict(out, x, cpre, h = 1)
```

fnets

*Factor-adjusted network estimation***Description**

Operating under factor-adjusted vector autoregressive (VAR) model, the function estimates the spectral density and autocovariance matrices of the factor-driven common component and the idiosyncratic VAR process, the impulse response functions and common shocks for the common component, and VAR parameters, innovation covariance matrix and long-run partial correlations for the idiosyncratic component.

**Usage**

```
fnets(
  x,
  center = TRUE,
  factor.model = c("unrestricted", "restricted"),
  q = NULL,
  q.method = c("bn", "er"),
  ic.op = NULL,
  kern.const = 4,
  common.args = list(var.order = NULL, max.var.order = NULL, trunc.lags = 20, n.perm =
    10),
  idio.var.order = 1,
  idio.method = c("lasso", "ds"),
  idio.args = list(tuning = c("cv", "ic"), n.iter = 100, tol = 0, n.cores =
    min(parallel::detectCores() - 1, 3)),
  idio.threshold = FALSE,
  lrpc.method = c("par", "npar", "none"),
  lrpc.adaptive = FALSE,
  cv.args = list(n.folds = 1, penalty = NULL, path.length = 10, do.plot = FALSE)
)
```

**Arguments**

<code>x</code>	input time series matrix, with each row representing a variable
<code>center</code>	whether to de-mean the input <code>x</code> row-wise
<code>factor.model</code>	a string specifying the method to be adopted for factor model estimation; possible values are: <ul style="list-style-type: none"> <li>"unrestricted" unrestricted factor model</li> <li>"restricted" restricted factor model</li> </ul>
<code>q</code>	number of unrestricted factors. If <code>q = NULL</code> , the factor number is estimated by an information criterion-based approach of Hallin and Liška (2007) or Bai and Ng (2002), or eigenvalue ratio, see <a href="#">hl.factor.number</a> and <a href="#">bn.factor.number</a> for further details

<code>q.method</code>	a string specifying the factor number selection method when <code>factor.model = "restricted"</code> ; possible values are: <ul style="list-style-type: none"> <li>• "bn" information criteria of Bai and Ng (2002)</li> <li>• "er" eigenvalue ratio</li> </ul>
<code>ic.op</code>	choice of the information criterion, see <a href="#">hl.factor.number</a> and <a href="#">bn.factor.number</a> for further details
<code>kern.const</code>	constant multiplied to $\text{floor}((\text{dim}(x)[2]/\log(\text{dim}(x)[2]))^{(1/3)})$ which determines the kernel bandwidth for dynamic PCA
<code>common.args</code>	a list specifying the tuning parameters required for estimating the impulse response functions and common shocks. It contains: <ul style="list-style-type: none"> <li>• <code>var.order</code> order of the blockwise VAR representation of the common component. If <code>var.order = NULL</code>, it is selected blockwise by Schwarz criterion</li> <li>• <code>max.var.order</code> maximum blockwise VAR order for the Schwarz criterion</li> <li>• <code>trunc.lags</code> truncation lag for impulse response function estimation</li> <li>• <code>n.perm</code> number of cross-sectional permutations involved in impulse response function estimation</li> </ul>
<code>idio.var.order</code>	order of the idiosyncratic VAR process; if a vector of integers is supplied, the order is chosen via tuning
<code>idio.method</code>	a string specifying the method to be adopted for idiosyncratic VAR process estimation; possible values are: <ul style="list-style-type: none"> <li>• "lasso" Lasso-type l1-regularised M-estimation</li> <li>• "ds" Dantzig Selector-type constrained l1-minimisation</li> </ul>
<code>idio.args</code>	a list specifying the tuning parameters required for estimating the idiosyncratic VAR process. It contains: <ul style="list-style-type: none"> <li>• <code>tuning</code> a string specifying the selection procedure for <code>idio.var.order</code> and <code>lambda</code>; possible values are: <ul style="list-style-type: none"> <li>– "cv" cross validation</li> <li>– "ic" information criterion</li> </ul> </li> <li>• <code>n.iter</code> maximum number of descent steps; applicable when <code>idio.method = "lasso"</code></li> <li>• <code>tol</code> numerical tolerance for increases in the loss function; applicable when <code>idio.method = "lasso"</code></li> <li>• <code>n.cores</code> number of cores to use for parallel computing, see <a href="#">makePSOCK-cluster</a>; applicable when <code>idio.method = "ds"</code></li> </ul>
<code>idio.threshold</code>	whether to perform adaptive thresholding of beta with <a href="#">threshold</a>
<code>lrpc.method</code>	a string specifying the type of estimator for long-run partial correlation matrix estimation; possible values are: <ul style="list-style-type: none"> <li>• "par" parametric estimator based on the VAR model assumption</li> <li>• "npar" nonparametric estimator from inverting the long-run covariance matrix of the idiosyncratic component via constrained l1-minimisation</li> <li>• "none" do not estimate the long-run partial correlation matrix</li> </ul>
<code>lrpc.adaptive</code>	whether to use the adaptive estimation procedure

- `cv.args` a list specifying arguments for tuning for selecting the tuning parameters involved in VAR parameter and (long-run) partial correlation matrix estimation. It contains:
- `n.folds` if `tuning = "cv"`, number of folds
  - `penalty` if `tuning = "ic"`, penalty multiplier between 0 and 1; if `penalty = NULL`, defaults to  $1/(1+\exp(\dim(x)[1]/\dim(x)[2]))$
  - `path.length` number of regularisation parameter values to consider; a sequence is generated automatically based in this value
  - `do.plot` whether to plot the output of the cross validation step

## Details

See Barigozzi, Cho and Owens (2021) for further details. List arguments do not need to be specified with all list components; any missing entries will be filled in with the default argument.

## Value

an S3 object of class `fnets`, which contains the following fields:

- |                          |  |
|--------------------------|--|
| <code>q</code>           | number of factors  |
| <code>spec</code>        | if <code>factor.model = "unrestricted"</code> a list containing estimates of the spectral density matrices for <code>x</code> , common and idiosyncratic components  |
| <code>acv</code>         | a list containing estimates of the autocovariance matrices for <code>x</code> , common and idiosyncratic components  |
| <code>common.irf</code>  | if <code>factor.model = "unrestricted"</code> and <code>q &gt;= 1</code> , a list containing estimators of the impulse response functions (as an array of dimension $(p, q, \text{trunc.lags} + 2)$ ) and common shocks (an array of dimension $(q, n)$ ) for the common component   |
| <code>lam</code>         | if <code>factor.model = "restricted"</code> , factor loadings  |
| <code>f</code>           | if <code>factor.model = "restricted"</code> , factor series  |
| <code>idio.var</code>    | a list containing the following fields: <ul style="list-style-type: none"> <li>• <code>beta</code> estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable</li> <li>• <code>Gamma</code> estimate of the innovation covariance matrix</li> <li>• <code>lambda</code> regularisation parameter</li> <li>• <code>convergence</code> returned when <code>idio.method = "lasso"</code>; indicates whether a convergence criterion is met</li> <li>• <code>var.order</code> VAR order</li> </ul> |
| <code>lrpc</code>        | see the output of <a href="#">par.lrpc</a> if <code>lrpc.method = 'par'</code> and that of <a href="#">npar.lrpc</a> if <code>lrpc.method = 'npar'</code>  |
| <code>mean.x</code>      | if <code>center = TRUE</code> , returns a vector containing row-wise sample means of <code>x</code> ; if <code>center = FALSE</code> , returns a vector of zeros   |
| <code>idio.method</code> | input parameter  |
| <code>lrpc.method</code> | input parameter  |
| <code>kern.const</code>  | input parameter  |

fnets.factor.model	<i>Factor model estimation</i>
--------------------	--------------------------------

---

## Description

Unrestricted and restricted factor model estimation

## Usage

```
fnets.factor.model(
  x,
  center = TRUE,
  factor.model = c("unrestricted", "restricted"),
  q = NULL,
  q.method = c("bn", "er"),
  ic.op = NULL,
```

```

    kern.const = 4,
    common.args = list(var.order = NULL, max.var.order = NULL, trunc.lags = 20, n.perm =
      10)
  )

```

## Arguments

<code>x</code>	input time series matrix, with each row representing a variable
<code>center</code>	whether to de-mean the input <code>x</code> row-wise
<code>factor.model</code>	a string specifying the method to be adopted for factor model estimation; possible values are: <ul style="list-style-type: none"> <li>• "unrestricted" unrestricted factor model</li> <li>• "restricted" restricted factor model</li> </ul>
<code>q</code>	number of factors. If <code>q = NULL</code> , the factor number is estimated by an information criterion-based approach of Hallin and Liška (2007) or Bai and Ng (2002), see <a href="#">hl.factor.number</a> and <a href="#">bn.factor.number</a> for further details
<code>q.method</code>	a string specifying the factor number selection method when <code>factor.model = "restricted"</code> ; possible values are: <ul style="list-style-type: none"> <li>• "bn" information criteria of Bai and Ng (2002)</li> <li>• "er" eigenvalue ratio</li> </ul>
<code>ic.op</code>	choice of the information criterion, see <a href="#">hl.factor.number</a> or <a href="#">bn.factor.number</a> for further details
<code>kern.const</code>	constant multiplied to $\text{floor}((\text{dim}(x)[2]/\log(\text{dim}(x)[2]))^{(1/3)})$ which determines the kernel bandwidth for dynamic PCA
<code>common.args</code>	a list specifying the tuning parameters required for estimating the impulse response functions and common shocks. It contains: <ul style="list-style-type: none"> <li>• <code>var.order</code> order of the blockwise VAR representation of the common component. If <code>var.order = NULL</code>, it is selected blockwise by Schwarz criterion</li> <li>• <code>max.var.order</code> maximum blockwise VAR order for the Schwarz criterion</li> <li>• <code>trunc.lags</code> truncation lag for impulse response function estimation</li> <li>• <code>n.perm</code> number of cross-sectional permutations involved in impulse response function estimation</li> </ul>

## Details

See Barigozzi, Cho and Owens (2021) for further details.

## Value

an S3 object of class `fnets`, which contains the following fields:

<code>q</code>	number of factors
<code>spec</code>	if <code>factor.model = "unrestricted"</code> a list containing estimates of the spectral density matrices for <code>x</code> , common and idiosyncratic components

acv	a list containing estimates of the autocovariance matrices for $x$ , common and idiosyncratic components
common.irf	if <code>factor.model = "unrestricted"</code> and $q \geq 1$ , a list containing estimators of the impulse response functions (as an array of dimension $(p, q, \text{trunc.lags} + 2)$ ) and common shocks (an array of dimension $(q, n)$ ) for the common component
lam	if <code>factor.model = "restricted"</code> factor loadings
f	if <code>factor.model = "restricted"</code> factor series
mean.x	if <code>center = TRUE</code> , returns a vector containing row-wise sample means of $x$ ; if <code>center = FALSE</code> , returns a vector of zeros

---

fnets.var

11-regularised Yule-Walker estimation for VAR processes

---

## Description

Estimates the VAR parameter matrices via 11-regularised Yule-Walker estimation and innovation covariance matrix via constrained 11-minimisation.

**Usage**

```
fnets.var(
  x,
  center = TRUE,
  method = c("lasso", "ds"),
  lambda = NULL,
  var.order = 1,
  cv.args = list(tuning = c("cv", "ic"), n.folds = 1, path.length = 10, do.plot =
    FALSE),
  idio.threshold = FALSE,
  n.iter = 100,
  tol = 0,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

**Arguments**

x	input time series matrix, with each row representing a variable
center	whether to de-mean the input x row-wise
method	a string specifying the method to be adopted for VAR process estimation; possible values are: <ul style="list-style-type: none"> <li>• "lasso" Lasso-type l1-regularised M-estimation</li> <li>• "ds" Dantzig Selector-type constrained l1-minimisation</li> </ul>
lambda	regularisation parameter; if lambda = NULL, tuning is employed to select the parameter
var.order	order of the VAR process; if a vector of integers is supplied, the order is chosen via tuning
cv.args	a list specifying arguments for tuning for selecting the regularisation parameter (and VAR order). It contains: <ul style="list-style-type: none"> <li>• tuning a string specifying the selection procedure for idio.var.order and lambda; possible values are: <ul style="list-style-type: none"> <li>– "cv" cross validation</li> <li>– "ic" information criterion</li> </ul> </li> <li>• n.folds if tuning = "cv", number of folds</li> <li>• penalty if tuning = "ic", penalty multiplier between 0 and 1; if penalty = NULL, defaults to <math>1/(1+\exp(\dim(x)[1])/\dim(x)[2])</math></li> <li>• path.length number of regularisation parameter values to consider; a sequence is generated automatically based in this value</li> <li>• do.plot whether to plot the output of the cross validation step</li> </ul>
idio.threshold	whether to perform adaptive thresholding of beta with <a href="#">threshold</a>
n.iter	maximum number of descent steps; applicable when method = "lasso"
tol	numerical tolerance for increases in the loss function; applicable when method = "lasso"
n.cores	number of cores to use for parallel computing, see <a href="#">makePSOCKcluster</a> ; applicable when method = "ds"

## Details

Further information can be found in Barigozzi, Cho and Owens (2021).

## Value

a list which contains the following fields:

beta	estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable
Gamma	estimate of the innovation covariance matrix
lambda	regularisation parameter
convergence	returned when method = "lasso"; indicates whether a convergence criterion is met
var.order	VAR order
mean.x	if center = TRUE, returns a vector containing row-wise sample means of x; if center = FALSE, returns a vector of zeros

## References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series. arXiv preprint arXiv:2201.06110.

## Examples

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
idio <- sim.var(n, p)
x <- idio$data

fv <- fnets.var(x,
  center = TRUE, method = "lasso", var.order = 1,
  cv.args = list(tuning = "cv", n.folds = 1, path.length = 10, do.plot = TRUE)
)
norm(fv$beta - t(idio$A), "F") / norm(t(idio$A), "F")
```

---

hl.factor.number

*Factor number estimator of Hallin and Liška (2007)*

---

## Description

Estimates the number of factors by minimising an information criterion over sub-samples of the data. Currently the three information criteria proposed in Hallin and Liška (2007) (ic.op = 1, 2 or 3) and their variations with logarithm taken on the cost (ic.op = 4, 5 or 6) are implemented, with ic.op = 5 recommended as a default choice based on numerical experiments.

**Usage**

```
hl.factor.number(x, q.max = NULL, mm, w = NULL, do.plot = FALSE, center = TRUE)
```

**Arguments**

x	input time series matrix, with each row representing a variable
q.max	maximum number of factors; if q.max = NULL, a default value is selected as $\min(50, \text{floor}(\sqrt{\min(\text{dim}(x)[2] - 1, \text{dim}(x)[1])}))$
mm	integer representing the kernel bandwidth
w	vector of length $2 * \text{mm} + 1$ containing symmetric weights; if w = NULL, default weights are generated using the Bartlett kernel and mm
do.plot	whether to plot the values of six information criteria
center	whether to de-mean the input x row-wise

**Details**

See Hallin and Liška (2007) for further details.

**Value**

a list containing	
q.hat	a vector containing minimisers of the six information criteria
Gamma_x	an array containing the estimates of the autocovariance matrices of x at $2 * \text{mm} + 1$ lags
Sigma_x	an array containing the estimates of the spectral density matrices of x at $2 * \text{mm} + 1$ Fourier frequencies
sv	a list containing the singular value decomposition of Sigma_x

**References**

Hallin, M. & Liška, R. (2007) Determining the number of factors in the general dynamic factor model. *Journal of the American Statistical Association*, 102(478), 603–617.

**Examples**

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data * apply(idio$data, 1, sd) / apply(common$data, 1, sd) + idio$data

hl <- hl.factor.number(x, q.max = NULL, mm = floor(4 * (n / log(n))^(1 / 3)), do.plot = TRUE)
hl$q.hat
```

---

 idio.predict

*Forecasting idiosyncratic VAR process*

---

### Description

Produces forecasts of the idiosyncratic VAR process for a given forecasting horizon by estimating the best linear predictors

### Usage

```
idio.predict(object, x, cpre, h = 1)
```

### Arguments

object	fnets object
x	input time series matrix, with each row representing a variable
cpre	output of <a href="#">common.predict</a>
h	forecast horizon

### Value

a list containing

is	in-sample estimator of the idiosyncratic component
fc	forecasts of the idiosyncratic component for a given forecasting horizon h
h	forecast horizon

### References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series. arXiv preprint arXiv:2201.06110.

### Examples

```
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.var.order = 1, idio.method = "lasso", lrpc.method = "none")
cpre <- common.predict(out, x, h = 1, common.method = "restricted", r = NULL)
ipre <- idio.predict(out, x, cpre, h = 1)
```

---

npar.lrpc	<i>Nonparametric estimation of long-run partial correlations of factor-adjusted VAR processes</i>
-----------	---

---

### Description

Returns a nonparametric estimate of long-run partial correlations of the VAR process from the inverse of long-run covariance matrix obtained via constrained L1-minimisation.

### Usage

```
npar.lrpc(
  object,
  x,
  eta = NULL,
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  do.correct = TRUE,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

### Arguments

object	fnets object
x	input time series matrix; with each row representing a variable
eta	regularisation parameter; if eta = NULL, it is selected by cross validation
cv.args	a list specifying arguments for the cross validation procedure for selecting the tuning parameter involved in long-run partial correlation matrix estimation. It contains: <ul style="list-style-type: none"> <li>• n.folds number of folds</li> <li>• path.length number of regularisation parameter values to consider; a sequence is generated automatically based in this value</li> <li>• do.plot whether to plot the output of the cross validation step</li> </ul>
do.correct	whether to correct for any negative entries in the diagonals of the inverse of long-run covariance matrix
n.cores	number of cores to use for parallel computing, see <a href="#">makePSOCKcluster</a>

### Value

a list containing	
Omega	estimated inverse of the long-run covariance matrix
lrpc	estimated long-run partial correlation matrix
eta	regularisation parameter

**Examples**

```
## Not run:
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.method = "lasso", lrpc.method = "none")
nlrpc <- npar.lrpc(out, x, cv.args = list(n.folds = 1, path.length = 10, do.plot = TRUE))
out$lrpc <- nlrpc
out$lrpc.method <- "npar"
plot(out, type = "lrpc", display = "heatmap", threshold = .05)

## End(Not run)
```

---

par.lrpc	<i>Parametric estimation of long-run partial correlations of factor-adjusted VAR processes</i>
----------	--

---

**Description**

Returns a parametric estimate of long-run partial correlations of the VAR process from the VAR parameter estimates and the inverse of innovation covariance matrix obtained via constrained l1-minimisation.

**Usage**

```
par.lrpc(
  object,
  x,
  eta = NULL,
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  lrpc.adaptive = FALSE,
  eta.adaptive = NULL,
  do.correct = TRUE,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

**Arguments**

object	fnets object
x	input time series matrix; with each row representing a variable
eta	regularisation parameter; if eta = NULL, it is selected by cross validation
cv.args	a list specifying arguments for the cross validation procedure for selecting the tuning parameter involved in long-run partial correlation matrix estimation. It contains:

	<ul style="list-style-type: none"> <li>• <code>n.folds</code> number of folds</li> <li>• <code>path.length</code> number of regularisation parameter values to consider; a sequence is generated automatically based in this value</li> <li>• <code>do.plot</code> whether to plot the output of the cross validation step</li> </ul>
<code>lrpc.adaptive</code>	whether to use the adaptive estimation procedure
<code>eta.adaptive</code>	regularisation parameter for Step 1 of the adaptive estimation procedure; if <code>eta.adaptive = NULL</code> , defaults to $2 * \sqrt{\log(\dim(x)[1])/\dim(x)[2]}$
<code>do.correct</code>	whether to correct for any negative entries in the diagonals of the inverse of long-run covariance matrix
<code>n.cores</code>	number of cores to use for parallel computing, see <a href="#">makePSOCKcluster</a>

## Details

See Barigozzi, Cho and Owens (2021) for further details, and Cai, Liu and Zhou (2016) for further details on the adaptive estimation procedure.

## Value

a list containing

<code>Delta</code>	estimated inverse of the innovation covariance matrix
<code>Omega</code>	estimated inverse of the long-run covariance matrix
<code>pc</code>	estimated innovation partial correlation matrix
<code>lrpc</code>	estimated long-run partial correlation matrix
<code>eta</code>	regularisation parameter
<code>lrpc.adaptive</code>	was the adaptive procedure used

## Examples

```
## Not run:
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.method = "lasso", lrpc.method = "none")
plrpc <- par.lrpc(out, x, cv.args = list(n.folds = 1, path.length = 10, do.plot = TRUE))
out$lrpc <- plrpc
out$lrpc.method <- "par"
plot(out, type = "pc", display = "network", threshold = .05)
```

```
plot(out, type = "lrpc", display = "heatmap", threshold = .05)

## End(Not run)
```

---

plot.fnets

*Plotting the networks estimated by fnets*

---

## Description

Plotting method for S3 objects of class `fnets`. Produces a plot visualising three networks underlying factor-adjusted VAR processes: (i) directed network representing Granger causal linkages, as given by estimated VAR transition matrices summed across the lags, (ii) undirected network representing contemporaneous linkages after accounting for lead-lag dependence, as given by partial correlations of VAR innovations, (iii) undirected network summarising (i) and (ii) as given by long-run partial correlations of VAR processes.

## Usage

```
## S3 method for class 'fnets'
plot(
  x,
  type = c("granger", "pc", "lrpc"),
  display = c("network", "heatmap"),
  names = NA,
  groups = NA,
  threshold = 0,
  ...
)
```

## Arguments

<code>x</code>	<code>fnets</code> object
<code>type</code>	a string specifying which of the above three networks (i)–(iii) to visualise; possible values are <ul style="list-style-type: none"> <li>• "granger" directed network representing Granger causal linkages</li> <li>• "pc" undirected network representing contemporaneous linkages; available when <code>x\$lrpc.method = "par"</code></li> <li>• "lrpc" undirected network summarising Granger causal and contemporaneous linkages; available when <code>x\$lrpc.method = "par"</code> or <code>x\$lrpc.method = "npar"</code></li> </ul>
<code>display</code>	a string specifying how to visualise the network; possible values are: <ul style="list-style-type: none"> <li>• "network" as an <code>igraph</code> object, see <a href="#">plot.igraph</a></li> <li>• "heatmap" as a heatmap, see <a href="#">imagePlot</a></li> </ul>
<code>names</code>	a character vector containing the names of the vertices
<code>groups</code>	an integer vector denoting any group structure of the vertices

threshold	if threshold > 0, hard thresholding is performed on the matrix giving rise to the network of interest
...	additional arguments

### Details

[fnets](#)

---

predict.fnets

*Forecasting by fnets*

---

### Description

Produces forecasts of the data for a given forecasting horizon by separately estimating the best linear predictors of common and idiosyncratic components

### Usage

```
## S3 method for class 'fnets'
predict(
  object,
  x,
  h = 1,
  common.method = c("restricted", "unrestricted"),
  r = NULL,
  ...
)
```

### Arguments

object	fnets object
x	input time series matrix, with each row representing a variable
h	forecasting horizon
common.method	a string specifying the method for common component forecasting; possible values are: <ul style="list-style-type: none"> <li>• "restricted" performs forecasting under a restricted factor model</li> </ul>

- "unrestricted" performs forecasting under an unrestrictive, blockwise VAR representation of the common component
- r                      number of restricted factors; if common.method = "restricted" and r = NULL, it is estimated as the maximiser of the ratio of the successive eigenvalues of the estimate of the common component covariance matrix, see Ahn and Horenstein (2013)
- ...                    not used

### Value

- a list containing
- forecast              forecasts for the given forecasting horizon
- common.pred          a list containing forecasting results for the common component
- idio.pred              a list containing forecasting results for the idiosyncratic component
- mean.x                mean.x argument from object

---

sim.restricted	<i>Simulate data from a restricted factor model</i>
----------------	---

---

### Description

Simulate the common component following an unrestricted factor model that admits a restricted representation; see the model (C2) in the reference.

### Usage

```
sim.restricted(n, p, q = 2, heavy = FALSE)
```

### Arguments

- n                      sample size
- p                      dimension
- q                      number of unrestricted factors; number of restricted factors is given by  $2 * q$
- heavy                if heavy = FALSE, common shocks are generated from `rnorm` whereas if heavy = TRUE, from `rt` with `df = 5` and then scaled by `sqrt(3 / 5)`

**Value**

a list containing

data	generated series
q	number of factors
r	number of restricted factors

**References**

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

**Examples**

```
common <- sim.restricted(500, 50)
```

---

sim.unrestricted	<i>Simulate data from an unrestricted factor model</i>
------------------	--

---

**Description**

Simulate the common component following an unrestricted factor model that does not admit a restricted representation; see the model (C1) in the reference.

**Usage**

```
sim.unrestricted(n, p, q = 2, heavy = FALSE)
```

**Arguments**

n	sample size
p	dimension
q	number of unrestricted factors
heavy	if heavy = FALSE, common shocks are generated from rnorm whereas if heavy = TRUE, from rt with df = 5 and then scaled by sqrt(3 / 5)

**Value**

a list containing

data	generated series
q	number of factors

**References**

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series. arXiv preprint arXiv:2201.06110

**Examples**

```
common <- sim.unrestricted(500, 50)
```

---

sim.var

---

*Simulate a VAR(1) process*

---

**Description**

Simulate a VAR(1) process; see the reference for the generation of the transition matrix.

**Usage**

```
sim.var(n, p, Gamma = diag(1, p), heavy = FALSE)
```

**Arguments**

n	sample size
p	dimension
Gamma	innovation covariance matrix; ignored if heavy = TRUE
heavy	if heavy = FALSE, common shocks are generated from <code>rnorm</code> whereas if heavy = TRUE, from <code>rt</code> with <code>df = 5</code> and then scaled by <code>sqrt(3 / 5)</code>

**Value**

a list containing	
data	generated series
A	transition matrix
Gamma	innovation covariance matrix

**References**

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

**Examples**

```
idio <- sim.var(500, 50)
```
