

# Package ‘fnets’

December 7, 2022

**Type** Package

**Title** Factor-adjusted Network Estimation and Forecasting for High-dimensional Time Series

**Version** 0.1.1

**Maintainer** Haeran Cho <haeran.cho@bristol.ac.uk>

**Description** Implements methods for network estimation and forecasting of high-dimensional time series exhibiting strong serial and cross-sectional correlations under a factor-adjusted vector autoregressive model.

**Depends** R (>= 4.1.0)

**Imports** lpSolve,  
parallel,  
doParallel,  
foreach,  
MASS,  
fields,  
igraph,  
RColorBrewer

**License** GPL (>= 3)

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.2

<code>common.predict</code>	<i>Forecasting the factor-driven common component</i>
-----------------------------	---

---

**Description**

Produces forecasts of the common component for a given forecasting horizon by estimating the best linear predictors

**Usage**

```
common.predict(object, x, h = 1, fc.restricted = TRUE, r = c("ic", "er"))
```

**Arguments**

<code>object</code>	fnets object
<code>x</code>	input time series matrix, with each row representing a variable
<code>h</code>	forecasting horizon
<code>fc.restricted</code>	whether to forecast using a restricted or unrestricted, blockwise VAR representation of the common component
<code>r</code>	number of restricted factors, or a string specifying the factor number selection method when <code>fc.restricted = TRUE</code> ; possible values are: <ul style="list-style-type: none"><li>• "ic" information criteria of Bai and Ng (2002)</li><li>• "er" eigenvalue ratio</li></ul>

**Value**

a list containing	
<code>is</code>	in-sample estimator of the common component
<code>fc</code>	forecasts of the common component for a given forecasting horizon <code>h</code>
<code>r</code>	restricted factor number
<code>h</code>	forecast horizon

## Examples

```
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, var.order = 1, var.method = "lasso", do.lrpc = FALSE)
cpre <- common.predict(out, x, h = 1, r = NULL)
ipre <- idio.predict(out, x, cpre, h = 1)
```

---

factor.number

*Factor number selection methods*

---

## Description

Methods to estimate the number of factor. Either maximises the ratio of successive eigenvalues, or minimises an information criterion over sub-samples of the data. For `fm.restricted = FALSE`, the three information criteria proposed in Hallin and Liška (2007) (`ic.op = 1, 2` or `3`) and their variations with logarithm taken on the cost (`ic.op = 4, 5` or `6`) are implemented, with `ic.op = 5` recommended as a default choice based on numerical experiments. For `fm.restricted = TRUE`, the three information criteria in Owens, Cho, and Barigozzi (2022) are implemented, with `ic.op = 2` recommended by default.

## Usage

```
factor.number(
  x,
  fm.restricted = FALSE,
  method = c("ic", "er"),
  q.max = NULL,
  do.plot = FALSE,
  center = TRUE
)
```

## Arguments

<code>x</code>	input time series matrix, with each row representing a variable
<code>fm.restricted</code>	whether to estimate the number of restricted or unrestricted factors
<code>method</code>	A string specifying the factor number selection method; possible values are: <ul style="list-style-type: none"> <li>• "ic" information criteria-based methods of Alessi, Barigozzi &amp; Capasso (2010) when <code>fm.restricted = TRUE</code> or Hallin and Liška (2007) when <code>fm.restricted = FALSE</code> modifying Bai and Ng (2002)</li> <li>• "er" eigenvalue ratio of Ahn and Horenstein (2013)</li> </ul>
<code>q.max</code>	maximum number of factors; if <code>q.max = NULL</code> , a default value is selected as <code>min(50, floor(sqrt(min(dim(x)[2] - 1, dim(x)[1])))</code>
<code>do.plot</code>	whether to plot the information criteria values
<code>center</code>	whether to de-mean the input <code>x</code> row-wise

## Details

For further details, see references.

## Value

if `method = "ic"`, a vector containing minimisers of the six information criteria, otherwise, the maximiser of the eigenvalue ratio

## References

## Examples

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data * apply(idio$data, 1, sd) / apply(common$data, 1, sd) + idio$data
```

```

hl <- factor.number(x, fm.restricted = FALSE, do.plot = TRUE)
hl
library(fnets)

set.seed(123)
n <- 500
p <- 50
common <- sim.restricted(n, p)
idio <- sim.var(n, p)
x <- common$data * apply(idio$data, 1, sd) / apply(common$data, 1, sd) + idio$data

abc <- factor.number(x, fm.restricted = TRUE, do.plot = TRUE)
abc

er <- factor.number(x, method = "er", fm.restricted = TRUE, do.plot = TRUE)
er

```

fnets

*Factor-adjusted network estimation*

## Description

Operating under a factor-adjusted vector autoregressive (VAR) model, the function estimates the spectral density and autocovariance matrices of the factor-driven common component and the idiosyncratic VAR process, the impulse response functions and common shocks for the common component, and VAR parameters, innovation covariance matrix and long-run partial correlations for the idiosyncratic component.

## Usage

```

fnets(
  x,
  center = TRUE,
  fm.restricted = FALSE,
  q = c("ic", "er"),
  ic.op = NULL,
  kern.bw = NULL,
  common.args = list(factor.var.order = NULL, max.var.order = NULL, trunc.lags = 20,
    n.perm = 10),
  var.order = 1,
  var.method = c("lasso", "ds"),
  var.args = list(tuning = c("cv", "bic"), n.iter = 100, tol = 0, n.cores =
    min(parallel::detectCores() - 1, 3)),
  do.threshold = FALSE,
  do.lrpc = TRUE,
  lrpc.adaptive = FALSE,
  tuning.args = list(n.folds = 1, penalty = NULL, path.length = 10, do.plot = FALSE)
)

```

**Arguments**

<code>x</code>	input time series matrix, with each row representing a variable
<code>center</code>	whether to de-mean the input <code>x</code> row-wise
<code>fm.restricted</code>	whether to estimate a restricted factor model using static PCA
<code>q</code>	<p>Either the number of factors or a string specifying the factor number selection method; possible values are:</p> <ul style="list-style-type: none"> <li>• "ic" information criteria-based methods of Alessi, Barigozzi &amp; Capasso (2010) when <code>fm.restricted = TRUE</code> or Hallin and Liška (2007) when <code>fm.restricted = FALSE</code> modifying Bai and Ng (2002)</li> <li>• "er" eigenvalue ratio of Ahn and Horenstein (2013)</li> </ul> <p>; see <a href="#">factor.number</a>.</p>
<code>ic.op</code>	choice of the information criterion penalty, see <a href="#">factor.number</a> for further details
<code>kern.bw</code>	a positive integer specifying the kernel bandwidth for dynamic PCA; defaults to $\text{floor}(4 * (\text{dim}(x)[2] / \log(\text{dim}(x)[2]))^{(1/3)})$
<code>common.args</code>	<p>a list specifying the tuning parameters required for estimating the impulse response functions and common shocks. It contains:</p> <ul style="list-style-type: none"> <li>• <code>factor.var.order</code> order of the blockwise VAR representation of the common component. If <code>factor.var.order = NULL</code>, it is selected blockwise by Schwarz criterion</li> <li>• <code>max.var.order</code> maximum blockwise VAR order for the Schwarz criterion</li> <li>• <code>trunc.lags</code> truncation lag for impulse response function estimation</li> <li>• <code>n.perm</code> number of cross-sectional permutations involved in impulse response function estimation</li> </ul>
<code>var.order</code>	order of the idiosyncratic VAR process; if a vector of integers is supplied, the order is chosen via tuning
<code>var.method</code>	<p>a string specifying the method to be adopted for idiosyncratic VAR process estimation; possible values are:</p> <ul style="list-style-type: none"> <li>• "lasso" Lasso-type l1-regularised M-estimation</li> <li>• "ds" Dantzig Selector-type constrained l1-minimisation</li> </ul>
<code>var.args</code>	<p>a list specifying the tuning parameters required for estimating the idiosyncratic VAR process. It contains:</p> <ul style="list-style-type: none"> <li>• <code>n.iter</code> maximum number of descent steps; applicable when <code>var.method = "lasso"</code></li> <li>• <code>tol</code> numerical tolerance for increases in the loss function; applicable when <code>var.method = "lasso"</code></li> <li>• <code>n.cores</code> number of cores to use for parallel computing, see <a href="#">makePSOCK-cluster</a>; applicable when <code>var.method = "ds"</code></li> </ul>
<code>do.threshold</code>	whether to perform adaptive thresholding of all parameter estimators with <a href="#">thresh-old</a>
<code>do.lrpc</code>	whether to estimate the long-run partial correlation
<code>lrpc.adaptive</code>	whether to use the adaptive estimation procedure

- `tuning.args` a list specifying arguments for tuning for selecting the tuning parameters involved in VAR parameter and (long-run) partial correlation matrix estimation. It contains:
- `tuning` a string specifying the selection procedure for `var.order` and `lambda`; possible values are:
    - `"cv"` cross validation
    - `"bic"` information criterion
  - `n.folds` if `tuning = "cv"`, positive integer number of folds
  - `penalty` if `tuning = "bic"`, penalty multiplier between 0 and 1; if `penalty = NULL`, defaults to  $1/(1+\exp(\dim(x)[1]/\dim(x)[2]))$
  - `path.length` positive integer number of regularisation parameter values to consider; a sequence is generated automatically based in this value
  - `do.plot` whether to plot the output of the cross validation step

### Details

See Barigozzi, Cho and Owens (2022) and Owens, Cho and Barigozzi (2022) for further details. List arguments do not need to be specified with all list components; any missing entries will be filled in with the default argument.

### Value

an S3 object of class `fnets`, which contains the following fields:

<code>q</code>	number of factors
<code>spec</code>	if <code>fm.restricted = FALSE</code> a list containing estimates of the spectral density matrices for <code>x</code> , common and idiosyncratic components
<code>acv</code>	a list containing estimates of the autocovariance matrices for <code>x</code> , common and idiosyncratic components
<code>loadings</code>	if <code>fm.restricted = TRUE</code> , factor loadings; if <code>fm.restricted = FALSE</code> and <code>q &gt;= 1</code> , a list containing estimators of the impulse response functions (as an array of dimension $(p, q, \text{trunc.lags} + 2)$ )
<code>factors</code>	if <code>fm.restricted = TRUE</code> , factor series; else, common shocks (an array of dimension $(q, n)$ )
<code>idio.var</code>	a list containing the following fields: <ul style="list-style-type: none"> <li>• <code>beta</code> estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable</li> <li>• <code>Gamma</code> estimate of the innovation covariance matrix</li> <li>• <code>lambda</code> regularisation parameter</li> <li>• <code>var.order</code> VAR order</li> </ul>
<code>lrpc</code>	see the output of <a href="#">par.lrpc</a>
<code>mean.x</code>	if <code>center = TRUE</code> , returns a vector containing row-wise sample means of <code>x</code> ; if <code>center = FALSE</code> , returns a vector of zeros
<code>var.method</code>	input parameter
<code>do.lrpc</code>	input parameter
<code>kern.bw</code>	input parameter

fnets.factor.model	<i>Factor model estimation</i>
--------------------	--------------------------------

---

## Description

Unrestricted and restricted factor model estimation

**Usage**

```
fnets.factor.model(
  x,
  center = TRUE,
  fm.restricted = FALSE,
  q = c("ic", "er"),
  ic.op = NULL,
  kern.bw = NULL,
  common.args = list(factor.var.order = NULL, max.var.order = NULL, trunc.lags = 20,
    n.perm = 10)
)
```

**Arguments**

<code>x</code>	input time series matrix, with each row representing a variable
<code>center</code>	whether to de-mean the input <code>x</code> row-wise
<code>fm.restricted</code>	whether to estimate a restricted factor model using static PCA
<code>q</code>	Either a string specifying the factor number selection method when <code>fm.restricted = TRUE</code> ; possible values are: <ul style="list-style-type: none"> <li>• "ic" information criteria of Hallin and Liška (2007) or Bai and Ng (2002), see <a href="#">factor.number</a></li> <li>• "er" eigenvalue ratio</li> </ul> ; or the number of unrestricted factors.
<code>ic.op</code>	choice of the information criterion penalty, see <a href="#">hl.factor.number</a> or <a href="#">abc.factor.number</a> for further details
<code>kern.bw</code>	kernel bandwidth for dynamic PCA; defaults to $4 * \text{floor}((\text{dim}(x)[2]/\log(\text{dim}(x)[2]))^{(1/3)})$
<code>common.args</code>	a list specifying the tuning parameters required for estimating the impulse response functions and common shocks. It contains: <ul style="list-style-type: none"> <li>• <code>factor.var.order</code> order of the blockwise VAR representation of the common component. If <code>factor.var.order = NULL</code>, it is selected blockwise by Schwarz criterion</li> <li>• <code>max.var.order</code> maximum blockwise VAR order for the Schwarz criterion</li> <li>• <code>trunc.lags</code> truncation lag for impulse response function estimation</li> <li>• <code>n.perm</code> number of cross-sectional permutations involved in impulse response function estimation</li> </ul>

**Details**

See Barigozzi, Cho and Owens (2022) for further details.

**Value**

an S3 object of class `fm`, which contains the following fields:

`q`                      number of factors

spec	if fm.restricted = FALSE a list containing estimates of the spectral density matrices for x, common and idiosyncratic components
acv	a list containing estimates of the autocovariance matrices for x, common and idiosyncratic components
loadings	if fm.restricted = TRUE, factor loadings; if fm.restricted = FALSE and q >= 1, a list containing estimators of the impulse response functions (as an array of dimension (p, q, trunc.lags + 2))
factors	if fm.restricted = TRUE, factor series; else, common shocks (an array of dimension (q, n))
mean.x	if center = TRUE, returns a vector containing row-wise sample means of x; if center = FALSE, returns a vector of zeros

fnets.var

11-regularised Yule-Walker estimation for VAR processes

---

## Description

Estimates the VAR parameter matrices via 11-regularised Yule-Walker estimation and innovation covariance matrix via constrained 11-minimisation.

**Usage**

```
fnets.var(
  x,
  center = TRUE,
  method = c("lasso", "ds"),
  lambda = NULL,
  var.order = 1,
  tuning.args = list(tuning = c("cv", "bic"), n.folds = 1, penalty = NULL, path.length
    = 10, do.plot = FALSE),
  do.threshold = FALSE,
  n.iter = 100,
  tol = 0,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

**Arguments**

x	input time series matrix, with each row representing a variable
center	whether to de-mean the input x row-wise
method	a string specifying the method to be adopted for VAR process estimation; possible values are: <ul style="list-style-type: none"> <li>• "lasso" Lasso-type l1-regularised M-estimation</li> <li>• "ds" Dantzig Selector-type constrained l1-minimisation</li> </ul>
lambda	regularisation parameter; if lambda = NULL, tuning is employed to select the parameter
var.order	order of the VAR process; if a vector of integers is supplied, the order is chosen via tuning
tuning.args	a list specifying arguments for tuning for selecting the regularisation parameter (and VAR order). It contains: <ul style="list-style-type: none"> <li>• tuning a string specifying the selection procedure for var.order and lambda; possible values are: <ul style="list-style-type: none"> <li>– "cv" cross validation</li> <li>– "bic" information criterion</li> </ul> </li> <li>• n.folds if tuning = "cv", positive integer number of folds</li> <li>• penalty if tuning = "bic", penalty multiplier between 0 and 1; if penalty = NULL, defaults to <math>1/(1+\exp(\dim(x)[1]/\dim(x)[2]))</math></li> <li>• path.length positive integer number of regularisation parameter values to consider; a sequence is generated automatically based in this value</li> <li>• do.plot whether to plot the output of the cross validation step</li> </ul>
do.threshold	whether to perform adaptive thresholding of VAR parameter estimator with <a href="#">threshold</a>
n.iter	maximum number of descent steps; applicable when method = "lasso"
tol	numerical tolerance for increases in the loss function; applicable when method = "lasso"
n.cores	number of cores to use for parallel computing, see <a href="#">makePSOCKcluster</a> ; applicable when method = "ds"

**Details**

Further information can be found in Barigozzi, Cho and Owens (2022).

**Value**

a list which contains the following fields:

beta	estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable
Gamma	estimate of the innovation covariance matrix
lambda	regularisation parameter
var.order	VAR order
mean.x	if center = TRUE, returns a vector containing row-wise sample means of x; if center = FALSE, returns a vector of zeros

**Examples**

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
idio <- sim.var(n, p)
x <- idio$data

fv <- fnets.var(x,
  center = TRUE, method = "lasso", var.order = 1,
  tuning.args = list(tuning = "cv", n.folds = 1, path.length = 10, do.plot = TRUE)
)
norm(fv$beta - t(idio$A), "F") / norm(t(idio$A), "F")
```

---

idio.predict

*Forecasting idiosyncratic VAR process*

---

**Description**

Produces forecasts of the idiosyncratic VAR process for a given forecasting horizon by estimating the best linear predictors

**Usage**

```
idio.predict(object, x, cpre, h = 1)
```

**Arguments**

object	fnets object
x	input time series matrix, with each row representing a variable
cpre	output of <a href="#">common.predict</a>
h	forecast horizon

**Value**

a list containing	
is	in-sample estimator of the idiosyncratic component
fc	forecasts of the idiosyncratic component for a given forecasting horizon h
h	forecast horizon

**References**

Barigozzi, M., Cho, H. & Owens, D. (2022) FNETS: Factor-adjusted network estimation and forecasting for high-dimensional time series. arXiv preprint arXiv:2201.06110.

Owens, D., Cho, H. & Barigozzi, M. (2022) fnets: An R Package for Network Estimation and Forecasting via Factor-Adjusted VAR Modelling

**Examples**

```
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, var.order = 1, var.method = "lasso", do.lrpc = FALSE)
cpre <- common.predict(out, x, h = 1, r = NULL)
ipre <- idio.predict(out, x, cpre, h = 1)
```

---

par.lrpc

---

*Parametric estimation of long-run partial correlations of factor-adjusted VAR processes*

---

**Description**

Returns a parametric estimate of long-run partial correlations of the VAR process from the VAR parameter estimates and the inverse of innovation covariance matrix obtained via constrained l1-minimisation.

**Usage**

```
par.lrpc(
  object,
  x,
  eta = NULL,
  tuning.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  lrpc.adaptive = FALSE,
  eta.adaptive = NULL,
  do.correct = TRUE,
  do.threshold = FALSE,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

**Arguments**

object	fnets object
x	input time series matrix; with each row representing a variable
eta	regularisation parameter; if eta = NULL, it is selected by cross validation
tuning.args	a list specifying arguments for the cross validation procedure for selecting the tuning parameter involved in long-run partial correlation matrix estimation. It contains: <ul style="list-style-type: none"> <li>• n.folds positive integer number of folds</li> <li>• path.length positive integer number of regularisation parameter values to consider; a sequence is generated automatically based in this value</li> <li>• do.plot whether to plot the output of the cross validation step, and if do.threshold = TRUE, plot the thresholding output</li> </ul>
lrpc.adaptive	whether to use the adaptive estimation procedure
eta.adaptive	regularisation parameter for Step 1 of the adaptive estimation procedure; if eta.adaptive = NULL, defaults to $2 * \sqrt{\log(\dim(x)[1]) / \dim(x)[2]}$
do.correct	whether to correct for any negative entries in the diagonals of the inverse of long-run covariance matrix
do.threshold	whether to perform adaptive thresholding of Delta and Omega parameter estimators with <a href="#">threshold</a>
n.cores	number of cores to use for parallel computing, see <a href="#">makePSOCKcluster</a>

**Details**

See Barigozzi, Cho and Owens (2022) for further details, and Cai, Liu and Zhou (2016) for further details on the adaptive estimation procedure.

**Value**

a list containing

Delta	estimated inverse of the innovation covariance matrix
Omega	estimated inverse of the long-run covariance matrix

pc	estimated innovation partial correlation matrix
lrpc	estimated long-run partial correlation matrix
eta	regularisation parameter
lrpc.adaptive	input argument

## Examples

```
## Not run:
set.seed(123)
n <- 500
p <- 50
common <- sim.unrestricted(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, var.method = "lasso", do.lrpc = FALSE)
plrpc <- par.lrpc(out, x, tuning.args = list(n.folds = 1, path.length = 10, do.plot = TRUE))
out$lrpc <- plrpc
out$do.lrpc <- TRUE
plot(out, type = "pc", display = "network", threshold = .05)
plot(out, type = "lrpc", display = "heatmap", threshold = .05)

## End(Not run)
```

---

plot.fnets

---

*Plotting the networks estimated by fnets*

---

## Description

Plotting method for S3 objects of class `fnets`. Produces a plot visualising three networks underlying factor-adjusted VAR processes: (i) directed network representing Granger causal linkages, as given by estimated VAR transition matrices summed across the lags, (ii) undirected network representing contemporaneous linkages after accounting for lead-lag dependence, as given by partial correlations of VAR innovations, (iii) undirected network summarising (i) and (ii) as given by long-run partial correlations of VAR processes. Edge widths are determined by edge weights.

**Usage**

```
## S3 method for class 'fnets'
plot(
  x,
  type = c("granger", "pc", "lrpc"),
  display = c("network", "heatmap"),
  names = NA,
  groups = NA,
  threshold = 0,
  ...
)
```

**Arguments**

x	fnets object
type	a string specifying which of the above three networks (i)–(iii) to visualise; possible values are <ul style="list-style-type: none"> <li>• "granger" directed network representing Granger causal linkages</li> <li>• "pc" undirected network representing contemporaneous linkages; available when <code>x\$do.lrpc = TRUE</code></li> <li>• "lrpc" undirected network summarising Granger causal and contemporaneous linkages; available when <code>x\$do.lrpc = TRUE</code></li> </ul>
display	a string specifying how to visualise the network; possible values are: <ul style="list-style-type: none"> <li>• "network" as an igraph object, see <a href="#">plot.igraph</a></li> <li>• "heatmap" as a heatmap, see <a href="#">imagePlot</a></li> </ul>
names	a character vector containing the names of the vertices
groups	an integer vector denoting any group structure of the vertices
threshold	if <code>threshold &gt; 0</code> , hard thresholding is performed on the matrix giving rise to the network of interest
...	additional arguments

**Details**

See Barigozzi, Cho and Owens (2022) for further details.

predict.fm	<i>Forecasting for factor models</i>
------------	--------------------------------------

---

## Description

Produces forecasts of the data for a given forecasting horizon by estimating the best linear predictors of the common component

## Usage

```
## S3 method for class 'fm'
predict(object, x, h = 1, fc.restricted = TRUE, r = c("ic", "er"), ...)
```

## Arguments

object	fm object
x	input time series matrix, with each row representing a variable
h	forecasting horizon
fc.restricted	whether to forecast using a restricted or unrestricted, blockwise VAR representation of the common component
r	number of restricted factors, or a string specifying the factor number selection method when fc.restricted = TRUE; possible values are: <ul style="list-style-type: none"> <li>• "ic" information criteria of Alessi, Barigozzi &amp; Capasso (2010)</li> <li>• "er" eigenvalue ratio</li> </ul>
...	not used

## Value

a list containing	
is	in-sample predictions
forecast	forecasts for the given forecasting horizon
r	factor number

predict.fnets

*Forecasting by fnets*

---

**Description**

Produces forecasts of the data for a given forecasting horizon by separately estimating the best linear predictors of common and idiosyncratic components

**Usage**

```
## S3 method for class 'fnets'
predict(object, x, h = 1, fc.restricted = TRUE, r = c("ic", "er"), ...)
```

**Arguments**

object	fnets object
x	input time series matrix, with each row representing a variable
h	forecasting horizon
fc.restricted	whether to forecast using a restricted or unrestricted, blockwise VAR representation of the common component
r	number of restricted factors, or a string specifying the factor number selection method when <code>fc.restricted = TRUE</code> ; possible values are: <ul style="list-style-type: none"> <li>• "ic" information criteria of Bai and Ng (2002)</li> <li>• "er" eigenvalue ratio</li> </ul>
...	not used

**Value**

a list containing	
forecast	forecasts for the given forecasting horizon
common.pred	a list containing forecasting results for the common component
idio.pred	a list containing forecasting results for the idiosyncratic component
mean.x	mean.x argument from object

ipre <- idio.predict(out, x, cpre.res, h = 1)
```

---

sim.restricted	<i>Simulate data from a restricted factor model</i>
----------------	---

---

**Description**

Simulate the common component following an unrestricted factor model that admits a restricted representation; see the model (C2) in the reference.

**Usage**

```
sim.restricted(n, p, q = 2, heavy = FALSE)
```

**Arguments**

n	sample size
p	dimension
q	number of unrestricted factors; number of restricted factors is given by $2 * q$
heavy	if heavy = FALSE, common shocks are generated from <code>rnorm</code> whereas if heavy = TRUE, from <code>rt</code> with <code>df = 5</code> and then scaled by <code>sqrt(3 / 5)</code>

**Value**

a list containing	
data	generated series
q	number of factors
r	number of restricted factors

## Examples

```
common <- sim.restricted(500, 50)
```

---

sim.unrestricted	<i>Simulate data from an unrestricted factor model</i>
------------------	--

---

## Description

Simulate the common component following an unrestricted factor model that does not admit a restricted representation; see the model (C1) in the reference.

## Usage

```
sim.unrestricted(n, p, q = 2, heavy = FALSE)
```

## Arguments

n	sample size
p	dimension
q	number of unrestricted factors
heavy	if heavy = FALSE, common shocks are generated from rnorm whereas if heavy = TRUE, from rt with df = 5 and then scaled by sqrt(3 / 5)

## Value

a list containing	
data	generated series
q	number of factors

## Examples

```
common <- sim.unrestricted(500, 50)
```

---

sim.var	<i>Simulate a VAR(1) process</i>
---------	----------------------------------

---

### Description

Simulate a VAR(1) process; see the reference for the generation of the transition matrix.

### Usage

```
sim.var(n, p, Gamma = diag(1, p), heavy = FALSE)
```

### Arguments

n	sample size
p	dimension
Gamma	innovation covariance matrix; ignored if heavy = TRUE
heavy	if heavy = FALSE, common shocks are generated from rnorm whereas if heavy = TRUE, from rt with df = 5 and then scaled by sqrt(3 / 5)

### Value

a list containing

data	generated series
A	transition matrix
Gamma	innovation covariance matrix

### References

### Examples

```
idio <- sim.var(500, 50)
```

---

threshold	<i>Edge selection for VAR parameter, inverse innovation covariance, and long-run partial correlation matrices</i>
-----------	---

---

### Description

Threshold the entries of the input matrix at a data-driven level to perform edge selection

### Usage

```
threshold(mat, path.length = 500, do.plot = FALSE)
```

### Arguments

mat	input parameter matrix
path.length	number of candidate thresholds
do.plot	whether to plot thresholding output

### Details

See Liu, Zhang, and Liu (2021) for more information on the threshold selection process

### Value

a list which contains the following fields:

threshold	data-driven threshold
thr.mat	thresholded input matrix
