

Package ‘fnets’

December 31, 2021

Type Package

Title Factor-adjusted Network Estimation and Forecasting for High-dimensional Time Series

Version 0.1.0

Maintainer Haeran Cho <haeran.cho@gmail.com>

Description Implements methods for network estimation and forecasting of high-dimensional time series exhibiting strong serial and cross-sectional correlations under a factor-adjusted vector autoregressive model.

Depends R (>= 3.1.2)

Imports lpSolve,
parallel,
doParallel,

<code>common.predict</code>	<i>Forecasting the factor-driven common component</i>
-----------------------------	-------------------------------------------------------

Description

Produces forecasts of the common component for a given forecasting horizon by estimating the best linear predictors

Usage

```
common.predict(  
  object,  
  x,  
  h = 1,  
  common.method = c("restricted", "unrestricted"),  
  r = NULL  
)
```

Arguments

<code>object</code>	fnets object
<code>x</code>	input time series matrix, with each row representing a variable
<code>h</code>	forecasting horizon
<code>common.method</code>	a string specifying the method for common component forecasting; possible values are: <ul style="list-style-type: none">• "restricted" performs forecasting under a restrictive static factor model• "unrestricted" performs forecasting under an unrestrictive, blockwise VAR representation of the common component
<code>r</code>	number of static factors; if <code>common.method = "restricted"</code> and <code>r = NULL</code> , it is estimated as the maximiser of the ratio of the successive eigenvalues of the estimate of the common component covariance matrix, see Ahn and Horenstein (2013)

Value

a list containing	
<code>is</code>	in-sample estimator of the common component
<code>fc</code>	forecasts of the common component for a given forecasting horizon <code>h</code>
<code>r</code>	static factor number
<code>h</code>	forecast horizon

fit.var	<i>l1-regularised Yule-Walker estimation for VAR processes</i>
---------	----------------------------------------------------------------

Description

Estimates the VAR parameter matrices via l1-regularised Yule-Walker estimation and innovation covariance matrix via constrained l1-minimisation.

Usage

```
fit.var(
  x,
  center = TRUE,
  method = c("lasso", "ds"),
  lambda = NULL,
  var.order = 1,
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  n.iter = 100,
  tol = 0,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

Arguments

x	input time series matrix, with each row representing a variable
center	whether to de-mean the input x row-wise
method	a string specifying the method to be adopted for VAR process estimation; possible values are: <ul style="list-style-type: none"> "lasso" Lasso-type l1-regularised M-estimation "ds" Dantzig Selector-type constrained l1-minimisation
lambda	regularisation parameter; if lambda = NULL, cross validation is employed to select the parameter

<code>var.order</code>	order of the VAR process; if a vector of integers is supplied, the order is chosen via cross validation
<code>cv.args</code>	a list specifying arguments for the cross validation procedure for selecting the regularisation parameter (and VAR order). It contains: <ul style="list-style-type: none"> • <code>n.folds</code> number of folds • <code>path.length</code> number of regularisation parameter values to consider; a sequence is generated automatically based in this value • <code>do.plot</code> whether to plot the output of the cross validation step
<code>n.iter</code>	maximum number of descent steps; applicable when <code>method = "lasso"</code>
<code>tol</code>	numerical tolerance for increases in the loss function; applicable when <code>method = "lasso"</code>
<code>n.cores</code>	number of cores to use for parallel computing, see makePSOCKcluster ; applicable when <code>method = "ds"</code>

Details

Further information can be found in Barigozzi, Cho and Owens (2021).

Value

a list which contains the following fields:

<code>beta</code>	estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable
<code>Gamma</code>	estimate of the innovation covariance matrix
<code>lambda</code>	regularisation parameter
<code>var.order</code>	VAR order
<code>mean.x</code>	if <code>center = TRUE</code> , returns a vector containing row-wise sample means of <code>x</code> ; if <code>center = FALSE</code> , returns a vector of zeros

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

Examples

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
idio <- sim.var(n, p)
x <- idio$data

fv <- fit.var(x, center = TRUE, method = 'lasso', var.order = 1)
norm(fv$beta - t(idio$A), 'F')/norm(t(idio$A), 'F')
```

fnets

*Factor-adjusted network estimation***Description**

Operating under factor-adjusted vector autoregressive (VAR) model, the function estimates the spectral density and autocovariance matrices of the factor-driven common component and the idiosyncratic VAR process, the impulse response functions and common shocks for the common component, and VAR parameters and innovation covariance matrix for the idiosyncratic component.

Usage

```
fnets(
  x,
  center = TRUE,
  q = NULL,
  ic.op = 5,
  kern.const = 4,
  common.args = list(var.order = 1, max.var.order = NULL, trunc.lags = 20, n.perm = 10),
  idio.var.order = 1,
  idio.method = c("lasso", "ds"),
  lrpc.method = c("par", "npar", "none"),
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE)
)
```

Arguments

x	input time series matrix, with each row representing a variable
center	whether to de-mean the input x row-wise
q	number of factors. If q = NULL, the factor number is estimated by an information criterion-based approach of Hallin and Liška (2007), see hl.factor.number for further details
ic.op	choice of the information criterion, see hl.factor.number for further details
kern.const	constant multiplied to $\text{floor}((\text{dim}(x)[2]/\log(\text{dim}(x)[2]))^{(1/3)})$ which determines the kernel bandwidth for dynamic PCA
common.args	a list specifying the tuning parameters required for estimating the impulse response functions and common shocks. It contains: <ul style="list-style-type: none"> • var.order order of the blockwise VAR representation of the common component. If var.order = NULL, it is selected blockwise by Schwarz criterion • max.var.order maximum blockwise VAR order for the Schwarz criterion • trunc.lags truncation lag for impulse response function estimation • n.perm number of cross-sectional permutations involved in impulse response function estimation

<code>idio.var.order</code>	order of the idiosyncratic VAR process; if a vector of integers is supplied, the order is chosen via cross validation
<code>idio.method</code>	a string specifying the method to be adopted for idiosyncratic VAR process estimation; possible values are: <ul style="list-style-type: none"> • "lasso" Lasso-type l1-regularised M-estimation • "ds" Dantzig Selector-type constrained l1-minimisation
<code>lrpc.method</code>	a string specifying the type of estimator for long-run partial correlation matrix estimation; possible values are: <ul style="list-style-type: none"> • "par" parametric estimator based on the VAR model assumption • "npar" nonparametric estimator from inverting the long-run covariance matrix of the idiosyncratic component via constrained l1-minimisation • "none" do not estimate the long-run partial correlation matrix
<code>cv.args</code>	a list specifying arguments for the cross validation procedures for selecting the tuning parameters involved in VAR parameter and (long-run) partial correlation matrix estimation. It contains: <ul style="list-style-type: none"> • <code>n.folds</code> number of folds • <code>path.length</code> number of regularisation parameter values to consider; a sequence is generated automatically based in this value • <code>do.plot</code> whether to plot the output of the cross validation step

Details

See Barigozzi, Cho and Owens (2021) for further details.

Value

an S3 object of class `fnets`, which contains the following fields:

<code>q</code>	number of factors
<code>spec</code>	a list containing estimates of the spectral density matrices for x, common and idiosyncratic components
<code>acv</code>	a list containing estimates of the autocovariance matrices for x, common and idiosyncratic components
<code>common.irf</code>	if $q \geq 1$, a list containing estimators of the impulse response functions (as an array of dimension $(p, q, \text{trunc.lags} + 2)$) and common shocks (an array of dimension (q, n)) for the common component
<code>idio.var</code>	a list containing the following fields: <ul style="list-style-type: none"> • beta estimate of VAR parameter matrix; each column contains parameter estimates for the regression model for a given variable • Gamma estimate of the innovation covariance matrix • lambda regularisation parameter • var.order VAR order
<code>lrpc</code>	see the output of par.lrpc if <code>lrpc.method = 'par'</code> and that of npar.lrpc if <code>lrpc.method = 'npar'</code>

mean.x	if center = TRUE, returns a vector containing row-wise sample means of x; if center = FALSE, returns a vector of zeros
idio.method	input parameter
lrpc.method	input parameter
kern.const	input parameter

hl.factor.number

Factor number estimator of Hallin and Liška (2007)

Description

Estimates the number of factors by minimising an information criterion over sub-samples of the data. Currently the three information criteria proposed in Hallin and Liška (2007) (ic.op = 1, 2 or 3) and their variations with logarithm taken on the cost (ic.op = 4, 5 or 6) are implemented, with ic.op = 5 recommended as a default choice based on numerical experiments.

Usage

```
hl.factor.number(x, q.max = NULL, mm, w = NULL, do.plot = FALSE, center = TRUE)
```

Arguments

<code>x</code>	input time series matrix, with each row representing a variable
<code>q.max</code>	maximum number of factors; if <code>q.max = NULL</code> , a default value is selected as <code>min(50, floor(sqrt(min(dim(x)[2] - 1, dim(x)[1])))</code>
<code>mm</code>	integer representing the kernel bandwidth
<code>w</code>	vector of length $2 * mm + 1$ containing symmetric weights; if <code>w = NULL</code> , default weights are generated using the Bartlett kernel and <code>mm</code>
<code>do.plot</code>	whether to plot the values of six information criteria
<code>center</code>	whether to de-mean the input <code>x</code> row-wise

Details

See Hallin and Liška (2007) for further details.

Value

a list containing

- `q.hat` a vector containing minimisers of the six information criteria
- `Gamma_x` an array containing the estimates of the autocovariance matrices of `x` at $2 * mm + 1$ lags
- `Sigma_x` an array containing the estimates of the spectral density matrices of `x` at $2 * mm + 1$ Fourier frequencies
- `sv` a list containing the singular value decomposition of `Sigma_x`

References

Examples

```
library(fnets)

set.seed(123)
n <- 500
p <- 50
common <- sim.common2(n, p)
idio <- sim.var(n, p)
x <- common$data * apply(idio$data, 1, sd)/apply(common$data, 1, sd) + idio$data

hl <- hl.factor.number(x, q.max = NULL, mm = floor(4 * (n/log(n))^(1/3)), do.plot = TRUE)
hl$q
```

idio.predict	<i>Forecasting idiosyncratic VAR process</i>
--------------	----------------------------------------------

Description

Produces forecasts of the idiosyncratic VAR process for a given forecasting horizon by estimating the best linear predictors

Usage

```
idio.predict(object, x, cpre, h = 1)
```

Arguments

object	fnets object
x	input time series matrix, with each row representing a variable
cpre	output of <code>common.predict</code>
h	forecast horizon

Value

a list containing	
is	in-sample estimator of the idiosyncratic component
fc	forecasts of the idiosyncratic component for a given forecasting horizon h
h	forecast horizon

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

npar.lrpc	<i>Nonparametric estimation of long-run partial correlations of factor-adjusted VAR processes</i>
-----------	---------------------------------------------------------------------------------------------------

Description

Returns a nonparametric estimate of long-run partial correlations of the VAR process from the inverse of long-run covariance matrix obtained via constrained l1-minimisation.

Usage

```
npar.lrpc(
  object,
  x,
  eta = NULL,
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  correct.zero = TRUE,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

Arguments

object	fnets object
x	input time series matrix; with each row representing a variable
eta	regularisation parameter; if eta = NULL, it is selected by cross validation
cv.args	a list specifying arguments for the cross validation procedure for selecting the tuning parameter involved in long-run partial correlation matrix estimation. It contains: <ul style="list-style-type: none"> • n.folds number of folds • path.length number of regularisation parameter values to consider; a sequence is generated automatically based in this value • do.plot whether to plot the output of the cross validation step
correct.zero	whether to correct for any zero-entries in the diagonals of the inverse of long-run covariance matrix
n.cores	number of cores to use for parallel computing, see makePSOCKcluster

Value

a list containing	
Omega	estimated inverse of the long-run covariance matrix
lrpc	estimated long-run partial correlation matrix
eta	regularisation parameter

Examples

```
## Not run:
set.seed(123)
n <- 500
p <- 50
common <- sim.common1(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.method = 'lasso', lrpc.method = 'none')
nlrpc <- npar.lrpc(out, x, cv.args = list(n.folds = 1, path.length = 10, do.plot = TRUE))
out$lrpc <- nlrpc
out$lrpc.method <- 'npar'
```

```
plot(out, type = 'lrpc', display = 'heatmap', threshold = .05)

## End(Not run)
```

par.lrpc	<i>Parametric estimation of long-run partial correlations of factor-adjusted VAR processes</i>
----------	------------------------------------------------------------------------------------------------

Description

Returns a parametric estimate of long-run partial correlations of the VAR process from the VAR parameter estimates and the inverse of innovation covariance matrix obtained via constrained L1-minimisation.

Usage

```
par.lrpc(
  object,
  x,
  eta = NULL,
  cv.args = list(n.folds = 1, path.length = 10, do.plot = FALSE),
  correct.zero = TRUE,
  n.cores = min(parallel::detectCores() - 1, 3)
)
```

Arguments

object	fnets object
x	input time series matrix; with each row representing a variable
eta	regularisation parameter; if eta = NULL, it is selected by cross validation
cv.args	a list specifying arguments for the cross validation procedure for selecting the tuning parameter involved in long-run partial correlation matrix estimation. It contains: <ul style="list-style-type: none"> • n.folds number of folds • path.length number of regularisation parameter values to consider; a sequence is generated automatically based in this value • do.plot whether to plot the output of the cross validation step
correct.zero	whether to correct for any zero-entries in the diagonals of the inverse of long-run covariance matrix
n.cores	number of cores to use for parallel computing, see makePSOCKcluster

Details

See Barigozzi, Cho and Owens (2021) for further details.

Value

a list containing

Delta	estimated inverse of the innovation covariance matrix
Omega	estimated inverse of the long-run covariance matrix
pc	estimated innovation partial correlation matrix
lrpc	estimated long-run partial correlation matrix
eta	regularisation parameter

References

Examples

```
## Not run:
set.seed(123)
n <- 500
p <- 50
common <- sim.common1(n, p)
idio <- sim.var(n, p)
x <- common$data + idio$data
out <- fnets(x, q = NULL, idio.method = 'lasso', lrpc.method = 'none')
plrpc <- par.lrpc(out, x, cv.args = list(n.folds = 1, path.length = 10, do.plot = TRUE))
out$lrpc <- plrpc
out$lrpc.method <- 'par'
plot(out, type = 'pc', display = 'network', threshold = .05)
plot(out, type = 'lrpc', display = 'heatmap', threshold = .05)

## End(Not run)
```

plot.fnets

Plotting the networks estimated by fnets

Description

Plotting method for S3 objects of class `fnets`. Produces a plot visualising three networks underlying factor-adjusted VAR processes: (i) directed network representing Granger causal linkages, as given by estimated VAR transition matrices aggregated across the lags, (ii) undirected network representing contemporaneous linkages after accounting for lead-lag dependence, as given by partial correlations of VAR innovations, (iii) undirected network summarising (i) and (ii) as given by long-run partial correlations of VAR processes.

Usage

```
## S3 method for class 'fnets'
plot(
  x,
  type = c("granger", "pc", "lrpc"),
  display = c("network", "heatmap"),
  names = NA,
  groups = NA,
  threshold = 0,
  ...
)
```

Arguments

x	fnets object
type	a string specifying which of the above three networks (i)–(iii) to visualise; possible values are <ul style="list-style-type: none"> • "granger" directed network representing Granger causal linkages • "pc" undirected network representing contemporaneous linkages; available when <code>x\$lrpc.method = "par"</code> • "lrpc" undirected network summarising Granger causal and contemporaneous linkages; available when <code>x\$lrpc.method = "par"</code> or <code>x\$lrpc.method = "npar"</code>
display	a string specifying how to visualise the network; possible values are: <ul style="list-style-type: none"> • "network" as an igraph object, see plot.igraph • "heatmap" as a heatmap, see imagePlot
names	a character vector containing the names of the vertices
groups	an integer vector denoting any group structure of the vertices
threshold	if <code>threshold > 0</code> , hard thresholding is performed on the matrix giving rise to the network of interest
...	additional arguments

Details

See Barigozzi, Cho and Owens (2021) for further details.

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

predict.fnets	<i>Forecasting by fnets</i>
---------------	-----------------------------

Description

Produces forecasts of the data for a given forecasting horizon by separately estimating the best linear predictors of common and idiosyncratic components

Usage

```
## S3 method for class 'fnets'
predict(
  object,
  x,
  h = 1,
  common.method = c("restricted", "unrestricted"),
  r = NULL,
  ...
)
```

Arguments

object	fnets object
x	input time series matrix, with each row representing a variable
h	forecasting horizon
common.method	a string specifying the method for common component forecasting; possible values are: <ul style="list-style-type: none"> • "restricted" performs forecasting under a restrictive static factor model • "unrestricted" performs forecasting under an unrestrictive, blockwise VAR representation of the common component
r	number of static factors; if common.method = "restricted" and r = NULL, it is estimated as the maximiser of the ratio of the successive eigenvalues of the estimate of the common component covariance matrix, see Ahn and Horenstein (2013)
...	not used

Value

a list containing

- forecast forecasts for the given forecasting horizon
- common.pred a list containing forecasting results for the common component
- idio.pred a list containing forecasting results for the idiosyncratic component
- mean.x mean.x argument from object

sim.common1

Simulate data from a dynamic factor model

Description

Simulate the common component following a dynamic factor model that does not admit a static representation; see the model (C1) in the reference.

Usage

```
sim.common1(n, p, q = 2)
```

Arguments

n	sample size
p	dimension
q	number of dynamic factors

Value

a list containing	
data	generated series
q	number of factors

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

Examples

```
common <- sim.common1(500, 50)
```

sim.common2	<i>Simulate data from a static factor model</i>
-------------	-------------------------------------------------

Description

Simulate the common component following a dynamic factor model that admits a static representation; see the model (C2) in the reference.

Usage

```
sim.common2(n, p, q = 2)
```

Arguments

n	sample size
p	dimension
q	number of dynamic factors; number of static factors is given by $2 * q$

Value

a list containing	
data	generated series
q	number of factors
r	number of static factors

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

Examples

```
common <- sim.common2(500, 50)
```

sim.var	<i>Simulate a VAR(1) process</i>
---------	----------------------------------

Description

Simulate a VAR(1) process; see the reference for the generation of the transition matrix.

Usage

```
sim.var(n, p, Gamma = diag(1, p))
```

Arguments

n	sample size
p	dimension
Gamma	innovation covariance matrix

Value

a list containing

data	generated series
A	transition matrix
Gamma	innovation covariance matrix

References

Barigozzi, M., Cho, H. & Owens, D. (2021) FNETS: Factor-adjusted network analysis for high-dimensional time series.

Examples

```
idio <- sim.var(500, 50)
```
